

以下是一段用 Python 代码描述该临床体征的例子，可以通过注释和变量清晰地记录肿块特征：

```
# 定义临床体征描述函数
def describe_breast_lump():
    location = "左侧乳房"
    quadrant = "外象限"
    palpability = "可触及"
    size_description = "花生粒大小"
    consistency = "质地硬"
    margin = "边界清晰"

    # 打印描述
    print(f"{location}的{quadrant}{palpability}肿块, {size_description}, {consistency}, {margin}")

    # 以结构化数据形式返回（便于后续分析或记录）
    return {
        "侧别": "左侧",
        "象限": "外象限",
        "可触及性": True,
        "大小描述": "花生粒大小",
        "质地": "硬",
        "边界": "清晰"
    }

# 调用函数
clinical_findings = describe_breast_lump()
print("\n结构化记录: ", clinical_findings)
```

如果你希望用更贴近实际医疗数据记录的方式（例如使用字典和枚举），也可以这样写：

```
from typing import Literal

breast_exam = {
    "side": "left",
    "quadrant": "outer",
    "palpable": True,
    "size_comparison": "peanut_size",
    "consistency": Literal["soft", "firm", "hard"] # 实际赋值 'hard'
    "margin": Literal["clear", "irregular", "spiculated"] # 实际赋值 'clear'
}

breast_exam["consistency"] = "hard"
breast_exam["margin"] = "clear"

print(breast_exam)
```

如果是要生成类似电子病历中的描述语句：

```
def generate_clinical_description():  
    return "左侧乳房外象限可触及花生粒大小肿块，质地硬，边界清晰。"  
  
print(generate_clinical_description())
```

这种 Python 描述方式便于后续扩展为乳腺肿块的自动分析或结构化存储。
